Kyberpass Announces Email-Security Platform for Outlook

[February 18, 2002 - 1:00pm CST] SAN JOSE, Calif. - Ebusiness-security developer Kyberpass Corp. today announced it has launched its Kyberpass Secure Email TrustPlatform, offering real-time advanced security and validation for public-key-infrastructure email systems used to exchange financial information and transactions.

The new system is integrated with Microsoft Outlook and available to large businesses and Identrus-member financial institutions at a cost of US\$30 per client for deployments of 1,000 or greater, beginning in March.

"The Kyberpass Secure E-mail TrustPlatform leverages the investment that thousands of organizations across the globe have made in Microsoft Exchange and Microsoft Outlook," said Thomas Nolan, Kyberpass president and CEO. "As enterprises increase their reliance on email for trusted e-business and place more demands on its capabilities, the Kyberpass Secure E-mail TrustPlatform will take the burden of implementing, administering and managing complex security policies and certificates away from both end-users and network administrators."
